AutoCAD is available in a variety of licensing models to meet your needs. Key Concepts in CAD Software Architecture Objectivity: CAD programs are a visualization tool for a "user-defined" space in which to create and modify a data model that, in the end, creates a 2D or 3D object. While the user is creating the data model, it is in effect disconnected from the computer; once completed, it is brought back into the computer, where the user can add geometry to it. The user is free to move, scale, and rotate the data model without any change in the actual behavior of the data model. Multiple monitors: CAD programs use their own definition of "space" for rendering, with their own internal coordinate system (called the absolute coordinate system, or ACIS) and a user-defined coordinate system (called the absolute or relative coordinate system, or ACS). Each user-interface window contains its own ACS, which is specific to the object being manipulated by the user in that window. In other words, the monitor that displays the object being manipulated by the user is different from the monitor that displays the model, and the latter monitor is different from the monitor that displays the user's data model. 3D objects are visualized using a combination of two types of windows: • A flat view, which shows 2D views of 3D surfaces (top, bottom, side, front, and back). • A wireframe view, which shows "visible" surfaces by showing the connections between the 3D surfaces (e.g., from a top view, the interior, front, and back of the box are visible). A 3D wireframe view is constructed by a combination of flat view windows (which are displayed in the background) and wireframe view windows (which are "on top" of the flat view windows). Objectivity: CAD programs are used to design a data model and then translate it into a 3D object, which in turn can be manipulated. The 3D objects are visualized using the ACS, which was initially selected by the user. The shape of the object, the colors of the object, and the lights on the object are defined by the user in the model, and the software automatically reflects the changes made to the model back into the rendered object. The DIA technology, which debuted in AutoCAD 2002, was replaced in AutoCAD 2013. AutoCAD 2018 will be the first release with this new technology, replacing both the DIA and DXF technologies. In addition to the standard APIs, the Enterprise Architecture has the ability to extend the core capabilities with either plugins (eg. for facility management, oil & gas engineering, manufacturing, etc.) or third-party applications, e.g., Autodesk Appmanage.
