Key AutoCAD 2023 features Textured Image Reflection Built-in textured image reflection can help reflect the appearance of textures on the surface of a 3D model. This new technology features a new technology called "passive reflection" that reflects visible light on the model by reflecting visible light off a second invisible reflector that is embedded in the 3D model. This new technology uses an embedded surface that is not visible to the user, meaning that it is invisible to the user when working in AutoCAD, ArchiCAD, or SketchUp and that it is equally invisible when viewing a model through a video player or 3D rendering program. You can use textured image reflection with the new object color function, whereby you can specify the color and value of an object that is reflected by a 3D surface. The surface may be reflective or non-reflective. You can use textured image reflection for a number of purposes, including to enhance the appearance of a model, when reflecting a model by itself, or in combination with a highly reflective or a highly transparent image. You can also use textured image reflection to optimize rendering performance, because models are no longer viewed in a 3D environment but rather in a 2D image that is displayed on a computer monitor. You can specify the angle at which the reflections appear and specify the reflection color, either by specifying a number or a color. You can also assign a reflection value for each ray of light. The reflection value specifies the amount of light that is reflected by
