Every game or product these days includes some form of 2D/3D skeletal animation. Spine is one of the most popular of these, so let's look at it.As a developer, you have spent a considerable amount of time optimizing the production, or unpacking and debugging the production, of your application.So, now you have the finished application. Sure it contains the skeleton of your application, but does it also contain a working rest of the features your customer requires? As an aside, considering the development time you are spending on this, a couple of features could save you weeks of work. More on this later.Now your customer wants a little more than the app you released last week.Do you deliver, or do you delay? The average new app these days is around 4-6 months in development. How can you possibly get that done in 6 months? Well, you can also sell it for 5-10x that development time.If you are taking a client job, your customer needs to feel confident that you are there to support the project, and not just leave.When you are developing an application you are providing something for your customer.Does that something appeal to you? If it doesn't, why would they want to pay you for it?Is it the skeletons, or is it the skins?Well, all a user wants to know is if you have made it easy for them to access these tools, can you make it so they learn to use them easily, and can you support them easily. So, let's focus on that for now.To get a look at the rest of Spine's features, let's look at the windows, or the actions menu. So, we are looking at the editor. The Editor has a number of tools. Let's look at the different parts.We have a Canvas. When we create a new scene, we can see a very basic canvas. There are a number of tools that will be shown in
