Source code is available for download. The source code is available as the 'C source' file. An Open-source Python implementation of the Python API is also available. It is called "AutoCAD Through Python" (ATP) and is made available under the Apache 2.0 open source licence. As of version 3.1, ObjectARX was replaced by the proprietary Addin library for version 2013 and later. XML Since AutoCAD 2002 the drawing objects have been serialized in XML format. With AutoCAD XAML (Autodesk XML Authoring Language) the graphical user interface (GUI) as well as the backend are based on XML. 1. Field of the Invention This invention relates to a magnetic recording medium for audio-visual magnetic recording and a manufacturing method therefor.

2. Prior Art Currently, the audio-visual magnetic recording systems are indispensable as electronic audio-visual recording systems. In a video tape recorder (VTR), it is desirable that the surface of a magnetic tape used for the recording be made smooth in order to obtain smooth reproduced images of high quality. There have been a variety of methods of making the surface of the magnetic tape smooth. One method is to make the surface of a tape, which is wound around a supply reel, smooth and then coat the surface of the tape with a smoothness-imparting agent. Another method is to wind the magnetic tape on a supply reel while a smoothing roller is being applied to the surface of the magnetic tape. The tape containing the smoothing roller is wound around a take-up reel and the take-up reel is rotated to impart a certain degree of smoothness to the tape. In the method wherein the smoothing roller is applied to the surface of the tape before winding the tape around the take-up reel, the tape tends to gather between the smoothing roller and the take-up reel. If the tape gathers in this manner, the thickness of the tape increases at the tape ends. This results in increased contact between the magnetic layer and a magnetic head at the tape ends. If a tracking servo is used, the data signals recorded in the magnetic tape will be distorted. The tape is generally wound around the take-up reel at a speed of 3,000 to 4,000 rpm, or so. It is also necessary to adjust the tension on the tape. If the tape is too slack, it may not be satisfactorily wound around the take-up reel. Conversely, if the tape is too taut, it may tend to be easily wound off the take-up reel. If the tape tends to be slack, the tape speed is increased to make the tape more taut. If the tape speed is increased in this manner, a tracking servo cannot be performed. In addition,

Rapidly send and incorporate feedback into your designs. Import feedback from printed paper or PDFs and add changes to your drawings automatically, without additional drawing steps. (video: 1:15 min.) Markup Assist helps ensure that the best representation of your designs is used by enabling you to easily and automatically add block references, annotations, and dimension text. Completely Automated Dimensioning: Set line widths and sizes using precise 0.5mm increments with the grid-based feature called "AutoDim." (video: 7:33 min.) Set line widths and sizes using precise 0.5mm increments with the grid-based feature called "AutoDim." (video: 7:33 min.) AutoDim keeps drawing dimensions aligned with parts of the drawing by creating grids and automatically adding dimension lines. If you want the dimension lines to have the same width as the line being dimensioned, choose from four different line styles: standard line, dashed line, dotted line, or dashed and dotted line. You can even change how the lines are spaced or aligned. Keep drawing dimensions aligned with parts of the drawing by creating grids and automatically adding dimension lines.
