Filters A filter is an effect that alters the way an image looks. You can use filters to achieve a completely different look to an image without having to do any hard image editing. For example, you can add grain, blur, saturation, or add color. Filters can be added to an image, or applied to a layer. You can add filters to multiple layers, or to just a single layer, such as a sky or a tree.

Filters are a fast way to achieve a desired look. For instance, the Add Noise filter adds various levels of noise and grain to an image. **Layers** Each layer is a separate image. Think of a layer as a separate picture that you can add to an image, add a transparency, move, or scale. For example, you can have several layers of people in an image and work on one person at a time. You can also combine layers, such as by adding a background layer and placing a layer with a logo over it. However, most filters are applied to the entire image and not specifically to a layer, and are not often changed. For example, you could apply a blur effect to the entire image, but if you wanted to blur only the faces of a photo, you could create a layer mask on the faces and apply a blur only to those faces. **Layer masks** Each layer in Photoshop has a mask. Think of a mask as a representation of the parts of the layer that should appear and the parts that shouldn't
