FactJ

FactJ provides a programming model that can be used from the language level, in which it is represented as a set of assertions, to a lower level, represented by an interaction between FactJ and Java, which is one of its supported platforms. FactJ's main purpose is to improve the developer's experience when using TDD (Test-Driven Development). FactJ's main aspects are: the fact system that represents states of models, which includes any kind of classes; the specification language, including assertions; FactJ can be used in its current form as an independent library, or be part of an other project as a plug-in. FactJ supports Java out of the box, and other environments can be easily implemented as plugins. FactJ provides a way to connect Java with tests. This allows you to make an application with a test runner. Any number of classes can be connected to the test runner to test the behavior of the application as a whole. FactJ gives you the following advantages: Allows you to test any kind of software that contains classes as part of the unit tests. Allows you to test objects that can be used, even if they have complex behavior. Allows you to write, in classes, the behavior without the need of the methods because they have already been tested. This allows you to add the behavior of a class, without making any changes to the class that will be used. Allows you to compare the behavior of objects used to that of another class, something that is very difficult to do with existing tools. Allows you to write tests that allow you to reuse the objects used for testing. Thanks to this you will be able to create tests that share a class with the object that will be tested. You can create and reuse tests in object-oriented paradigms. The FactJ API makes it easier to write and reuse tests, saving developers time. By making use of FactJ you can easily test any software that contains classes. This means you can test any kind of software you use with FactJ. FactJ's Tested Software What software has been tested using FactJ? Open Source Software Ensim: Issue tracker and bug tracer Ensim is a free, open-source issue tracker and bug tracker written in Java. Ensim comes with built-in testing framework FactJ. It allows the fact engine to support unit testing and functional testing

What's New In FactJ?

FactJ is a lightweight and easy to implement Java API that provides implementations of invariants and assertions. When you need to test a class that is complex, FactJ helps you write the tests that help you focus on the specific areas you need to test. When you need to write a test that needs to take more than a couple of lines of code, FactJ provides you with the flexibility to use FactJ assertions instead of writing boilerplate code to do something simple. In addition to the assertions provided by FactJ, FactJ's Javadoc allows you to create easy-to-read documentation for your API. FactJ Example: `Assert.assertThat(myObject, equalTo(expectedObject));` FactJ Relation to JUnit: FactJ is very simple to use and based on JUnit. FactJ makes it easy to work with objects whose states (or invariants) may change. FactJ's assertion classes behave very much like the assertion classes provided by JUnit. You can combine FactJ and JUnit assertions into one list and easily filter them with JUnit-like syntax. FactJ is available in public release 0.5.0 - 2014-04-22 FactJ API Documentation We provide the Java API for FactJ so you can start working with FactJ today. We also provide a Mockito Test Framework for FactJ to allow you to test FactJ easily and efficiently. FactJ brings together several key concepts in order to help you write clean and maintainable tests. - You can use FactJ with classes that have invariants (properties) whose current state may change. - You can use FactJ to write test-driven development - You can easily extend FactJ with your own custom assertions FactJ Release Notes: - FactJ 0.5.0 is a free release and you can use it today - FactJ integrates with Groovy and Mockito 0.4.0 - 2014-03-04 FactJ API Documentation The Java API for FactJ (introduced in FactJ 0.3.2) is now released. It provides you with a simple implementation of FactJ in which you write assertion classes that are used by the FactJ framework. The Javadoc generates a simple usage example for each assertion class so that you can easily start using it. FactJ and the Mockito Test Framework You can easily use FactJ along
