infection were enrolled in this study. The patients included were the HIV patients who were diagnosed with PCP in Tianjin Union Center Hospital between January 1, 2000 and December 31, 2004. The clinical manifestations, laboratory data and the response to the treatment of the PCP, and the overall survival time of the patients were analyzed retrospectively. Of the 623 HIV-infected patients with PCP, the rate of CD(4) T cell depletion was 76.0%. The median survival time of all patients was 20.0 months. The median survival time of patients with PCP was less than 2 months in two groups of anti-retroviral therapy (ART) responders and non-responders. The survival time was longer in patients who had received
