Motion capture has proven to be a very valuable tool for game developers to gather precise information about the dynamic nature of human movement. The technology is used to capture, record and analyse an individual's movement – assessing the size of the player, muscle movement and the detection of injury. Real-life players play a game like FIFA in a motion capture suit while cameras record their movement and then at a later time video footage from the game is matched against the footage captured from the motion capture suit. This allows the game developer to capture and model a player's movement to find out how he or she moves in real life. The more accurate the information available on the movements and collisions of players, the more authentic the simulation will be. The technology has opened up new creative opportunities for game designers – and the ability to develop a global game engine has been the result. Enthusiasts are excited about the possibility of using the latest motion capture technology in the next step of the FIFA franchise – FIFA 23.

Rheumatologist and Ph.D. candidate at University of Western Australia, Dr. Julie Van de Velde has closely studied the use of motion capture technology in a hospital environment, where she had the opportunity to work with players suffering from injury. Dr. Van de Velde has published papers on the biomechanics of players with lower-limb injury who participated in a 4-month sports injury rehabilitation program (an industry standard injury rehabilitation program used across North America) and in elite athletes with lower-limb injury or surgery (identified through research projects at the University of Western Australia). “Our research has shown that with motion capture technology, the rehabilitation of players could be revolutionised,” said Dr. Van de Velde. Through the analysis of motion capture data from professional athletes with sports injuries, Dr. Van de Velde has been able to identify biomechanical clues to health issues and risks of injury. “Our research is now being applied in an industry setting. We are using the findings from FIFA to guide footballers as they recover from their injuries and return to sport,” said Dr. Van de Velde. “The capabilities of this technology have never been harnessed in the same way to simulate the movement and collision detection of a player,” explained FIFA technical director Andy Roxburgh. “It's taken us a while to create the technology, but now we've managed to do it

That means there's no way to play through the game as a positive character who is doing things to save the world from a giant infestation of extraterrestrial creatures. It's up to you to explore a derelict spaceship in search of your life. There's lots of ways to die in Alien: Isolation. Players can die from monster attacks, from running into exposed wires, from being crushed by heavy machinery. This wasn't new ground for videogames. People died in Bomberman and in E.V.R. and in tons of other games. What makes Alien: Isolation different is how it puts the player in the place of Amanda Ripley, the daughter of Ellen Ripley who hasn't been seen in 40 years. We know she's still alive because there's blood on the floor, the ship's internal computers are still operating, and Ripley's trademark voice actress, Sigourney Weaver, reprises her role in the game. Is that enough? Not really, but the game succeeds in its attempt. Although human contact with the creatures is terrifying, the game never makes Ripley a character who is afraid of the creatures. She's determined. She's scrappy. She does things that put herself at risk because she wants to survive. This is in marked contrast to another recent scare movie, John Carpenter's The Thing. The John Carpenter film shares a lot of DNA with Alien, but The Thing focuses on a small group of man-made objects that have fallen into the Arctic tundra. These items are assembled and become part of a strange alien creature. Ripley, as the daughter of a
