Image-editing software Photoshop isn't the only image-editing program available for the digital camera. Some programs are oriented toward pros and are full of advanced tools. Others are designed for beginners who want to edit a few images without spending hours in front of a monitor. In either case, selecting the right program can be a challenge, so we've pulled together a short list of some of the best. Want more information on working with digital images? We've written three books

on this topic, all of which you can find at ``www.dummies.com/wiley/photoshopcs6editing``.

Preparing Images for Web Inexpensive web hosts often have limits on the number of files you can upload or the number of images a single file can contain. To make the most of your web hosting, consider placing images for web use on a separate hard drive or on your computer's internal memory. To do so, use the steps that follow.

Save images for web The best way to prepare images for web use is to use the Photoshop file format. However, when you save a file as a web image (`` .jpg ``, for example), you can then edit that image with any software or use any common image-editing tools available to you. Any image editing tool can open and manipulate a `` .jpg `` image without having to convert it to a

separate format. When you use any image editing tool, after you create a file in the usual way, you can then proceed directly to editing it by opening the image in Photoshop. Be aware that you may not be able to export the image to a web format directly — you must convert the file to a web format first. The most common way to do this is to export the file to a JPEG format and then use that file in the uploading process. Figure 6-1 shows a graphic I created in Photoshop. To use this image in its web form, I exported it as a

with color and exposure, and compose better images. In Part 2, we are going to focus on multiple images. We will work with layer styles to create a simple collage. Import Image into PS

When you're beginning your Photoshop editing project, it's always a good idea to start with a fresh image. A new image can be useful for a variety of tasks. As you become more experienced, you may use more images in your images. We will begin by opening a new image in Photoshop. If your image already exists, you can save it before opening it in Photoshop. However, to make things easier, we will open a new file instead. In the Layers panel, choose File, New and open a blank document. Your image will be open in the Canvas window. In the Canvas, you will see a blank white canvas with your document file at

the bottom of the panel. Navigate to your image file in the left hand folder panel and then click on Open. Select the layer you would like to work on. You will notice a change in the Layers panel. Note: If you are opening an image for the first time in Photoshop, it will appear as a new layer in the Layers panel. If you have opened a new file that was already on your computer, an image will be loaded into the Layers panel. Adding More Layers We're going to focus on one layer at a time because there are many options for manipulating the visual elements of your image. If you open an image that has multiple layers, you will likely use the transform and adjustments panels to make changes to layers. The layers in the Layers panel are organized by type: color, exposure, effects,

dimensions and layer mask. All of the color and color-related layers have been flattened and are visible in the Layers panel. We will expand on this later in this tutorial. Color Image AdobeStock.com Before using the color of your image, it is best to adjust the color to your taste. With color, it's important to take a moment to think about how you would want to alter the color of your image. Color is a very important part of your 388ed7b0c7

New JerseyHello everyone, We plan to run a
Linux-based game server for an MMO game.
While I have done some work with Linux, not
much unfortunately. We only need the server
to run some basic things, such as provide a
user area for the client, and the game specific
database. We want a couple of things: - the
server should not run as root, ideally should
not even have suid - the server should be
based on debian and preferably should be a
LAMP install - the server should be cloud
based - the server should be free as in beer
Does anyone know anything about this?
Thanks in advance, Bart De Mooij FILED NOT
