## Shell Dep 32.37.20.10

One is struck by the similarity of Shells summation to other major oil-company analyses of the time. These tended to adopt a similar assumption that the coming energy transition from fossil fuels was inevitable and offered little hope. This was not to suggest that many fossil-fuel-based companies did not invest in renewable energy, such as solar power, or set realistic and useful targets for energy efficiency. It was just that others, like Shell, gave so little weight to renewables that it was possible to argue they had given up on a transition to a low carbon economy. Shell illustrates the industry response to the information it has today, and its potential for shaping our energy choices. "The superposition of the tracks of market responses to analysis," the authors suggest, "can be seen as a modern example of the way in which science transforms society." Unlike many of their peers, Shell did not settle for a largely negative approach in addressing climate change. Although it took a minimalist approach, Shells 1981 study, commissioned from CRU, offered hope: In the period since 1981, Shell has continued to explore this alternative scenario. It concluded that the prediction of a lower emissions peak, and a CO2-based business plan, has not been proved incorrect. Although there are uncertainties, the emissions will be higher in many countries. In addition, Shells analysis assumed that emissions from producing, installing and operating new power generation facilities would exceed those from the combustion of coal and oil. This data must be treated with caution, but it is generally accepted that zero emissions from new power plants would be technically feasible.
