This preset was created using a programmer's kit from the first Apple Lisa computer, the Lisa. It includes some very advanced features that are normally too complex for the average user. This preset is best suited for programmers who want to see just how powerful the KEYMACRO language really is. KeyMacro comes with a text editor and a library of objects, including curves, circles, rectangles, vectors, grids and polygons. It is the only macro language that makes use of Vector Objects, which allows the user to draw on their own graphics cards using freeform shapes. KeyMacro is a macro language that allows the programmer to create programs that can be later executed on a variety of devices, including non-Apple computers, handhelds, cell phones and portable game consoles. The programs can be saved and easily run later, even if the computer doesn't have any pre-installed macro language at all. The main goal of KeyMacro is to create programs that operate on the computer or handheld devices with little or no programming experience, allowing the user to perform any desired action by selecting the object, moving the

cursor, clicking the object and typing the command. Some of the different commands that can be used in KeyMacro: The Single Object Command Allows the programmer to perform any action on the selected object, including drawing the object, adding text and images, removing objects or moving the objects around. The Command List This command is used to define which commands should be performed when the user clicks on the object. The Size and Shape Commands The KeyMacro library includes a variety of types of objects. The use of the Size and Shape commands allows the programmer to change the size of an object, change its shape, change the amount of space between objects or rotate objects. A few commands in KeyMacro will allow you to create a short program with a few commands, which is perfect for testing KeyMacro's capabilities. The Speed Command This command is used to set the speed at which the selected object will move. The Date & Time Command This command can be used to change the date and time on any computer or handheld device. The Random Number Command This command will generate a random number. The Spell Checker Command This command will look for the misspelled words on the current page. The Comment Command This command will highlight or delete the selected text and 2edc1e01e8
