Field of the Invention The present invention relates to a fuse and, more particularly, to a miniature fuse with a horizontal mounting structure.

2. Brief Description of the Related Art Fuses are widely used in various electrical appliances and are generally installed vertically in a fuse box or horizontally in a fuse rack. The conventional horizontal fuse usually includes a fuse receptacle with a horizontal base mounted on a fuse rack. The base further includes a plurality of cavities defined in the base, each cavity accommodating a fuse. During installation, all the cavities of the fuse receptacle are aligned and, thereafter, all the fuses are packed into the cavities. Such alignment and packing increases the time and difficulty of mounting fuses on the fuse rack. In addition, since the electric power is not seriously affected when a fuse blows, the fuse is not subjected to a static load test before packing. Therefore, it is difficult to determine whether a fuse is intact or blown. It is an object of the present invention to provide an improved fuse for enhancing the aesthetic appearance of the fuse box. According to the present invention, the fuse includes a housing, a horizontal base mounted on the housing, a removable partition enclosing the horizontal base and having a first end and a second end, a fuse-holding housing adapted in a recess defined on the housing, and a fuse accommodated in the fuse-holding housing. In the fuse, the first end of the removable partition may be snapped into a first groove of the fuse-holding housing so that the second end of the removable partition is out of the recess. In this way, the fuse may be mounted on the fuse-holding housing. Further benefits and advantages of the present invention will become apparent after a careful reading of the detailed description with appropriate reference to the accompanying drawings.
