Photoshop has come along way since Adobe revolutionized printing by offering images to newspapers early on. It's now well known and widely used as one of the industry's best for picture-editing. Today, Photoshop is one of the most advanced image-editing programs out there. If you understand basic image naming and image editing techniques, you will be able to use almost all of Photoshop's power. There are no other programs that can do what Photoshop can. Once you learn the basics of how to use it, Photoshop is easy to use and navigate. You need only a basic of knowledge of file formats to get started. Virtually everyone is familiar with the common TIFF files, JPGs, PSDs, and EPS files. While we've never personally used Photoshop, although we've done extensive work with Adobe Photoshop Elements, we've heard that it's very intuitive and easy to learn. The program is also very fast, no matter how much you add and how many albums you've created. Lightroom, on the other hand, is a completely different animal. It's an amazing program created to clean-up your digital photos. It can export files in more than one way, be it a slim-line computer file, a Zip, or a CD. Unlike Photoshop, Lightroom does not have the ability to make your photos magically appear in print. All it can do is create reproductions of your photos off your hard drive. You'll need a separate program to make web pages and other graphics, such as a web server and a graphics editor, like Photoshop. Once you transfer photos to Lightroom, you'll notice that often your images are a bit sharper than ones you've seen in Photoshop. Anyone with an attention to quality will be pleased with Lightroom's output.

Doing a simple white text on a black background can be a good first step so you can learn how to use this software. After that you can either learn how to change color swatches depending on the colors that you are already using or you can start from scratch. If you are looking to learn how to do this in Adobe Photoshop just learn how to make layers. Layers are how you separate the taking of a picture from the design work that is required to turn it into a successful piece of art or logo design. Why spend hours designing a typeface or logo when you can use a design template and get it done in a few minutes? I know because I've designed using one. Simply create a new document in Adobe InDesign and follow these steps to create a design template that you can use as a standard download for yourself to use over and over again as a quick and easy template. The easiest way to do this is to take an existing document that you'd like to use as a template such as a flyer, sales page or blog design and, using Photoshop, create a new layer for the text. Simply cut this layer out and you'll have an all-new template for your next project. Here's how you do it:

1. Create a new document (let's call it the photo.indd file)
2. Select the page you'd like to use as the template, then go to File > Create > Blank Document. Make sure the Auto-Layout option is checked, then click OK, and the new document is created. With Adobe technology, you're no longer limited to working with just a single monitor. With All-In-One, you can import your content from any of your favorite photo apps and manage all your images across your entire workflow, including editing, sharing, and managing your assets. Not only will you be able to see all your images at once, you can layer changes and continue working on them right away.
