Vamos Que Nuestras Cocinas Book Info.Glutathione protects tumor cells from the cytotoxic effects of telomerase antisense oligonucleotides. A variety of studies have described the use of antisense oligonucleotides to inhibit cancer-related genes for their potential therapeutic applications. Most antisense strategies have relied on the nucleotide sequence complementarity of their oligonucleotides to induce the enzymatic degradation of targeted mRNAs. However, the use of unprotected antisense oligonucleotides has raised concern regarding their stability and specificity. Here, we analyzed the in vitro behavior of antisense oligonucleotides against human telomerase RNA. Our data clearly indicate that such oligonucleotides, as naked or with partial duplex-forming CPG as delivery vehicle, are rapidly degraded by nucleases and do not efficiently accumulate in cells. In contrast, the introduction of the tripeptide glutathione (GSH) in the oligonucleotide structure enhanced its stability in the culture medium and in the presence of DNA and markedly improved its uptake in cells. Accordingly, the addition of GSH to the culture medium of tumor cells and cancer cell lines inhibited telomerase activity, and such inhibition was accompanied by a reduction in cell growth. Interestingly, the addition of GSH to the culture medium of tumor cell lines as a single agent was sufficient to inhibit telomerase activity, suggesting that the GSH vehicle could protect the oligonucleotide against degradation by extracellular nucleases and be absorbed by endocytotic processes. In summary, our results demonstrate the therapeutic potential of GSH-protected antisense oligonucle
